

TANK BLANKETING REGULATORS BKRI2

DESCRIPTION

Tank blanketing valves are commonly used in tank storage systems to prevent and protect against explosions (avoiding flammable liquids being vented from the vessel), to control product contamination against external air that may fill the vapour space, to reduce evaporation losses (consequently, production losses), to reduce internal corrosion (caused by air and moisture) and to prevent vacuum condition.

The blanketing process consists in covering the stored medium, usually a liquid, with a gas (normally N2).

Compact design.

Non-rising adjustment knob.

STANDARD SURFACE FINISH

Internal movable parts and machined surfaces:

≤ 0,76 micron Ra – SF3. Other surfaces: as casted. Ultrasonic cleaning.

OPTIONS: Diaphragm leakage line connection.

Gauge connection on body.

External pulse line (recommended for low set

pressures < 10 mbar or high flow).

Dome-loaded version. Blanketing with vacuum.

Top cap (adjustment screw with cover).

ATEX (version.

USE: Compressed air, nitrogen and other gases

compatible with the construction.

AVAILABLE

MODELS: BKRI2 – low pressure regulator.

SIZES: DN 15 and DN 25.

REGULATING

RANGES: 5 to 10 mbar; 10 to 50 mbar; 20 to 200 mbar;

50 to 500 mbar; 5 to 4000 mbar (dome-loaded).

CONNECTIONS: Flanged EN 1092-1 PN 16.

INSTALLATION: Vertical installation recommended, to allow

drainage, or horizontal as close to the process as possible in order to prevent long pipe sections

and flow restrictions.

See IMI - Installation and maintenance

instrucions.
